

TPS27081A 1.2-V to 8-V, 3-A PFET High-Side Load Switch With Level Shift and Adjustable Slew Rate Control

1 Features

- Low ON-Resistance, High-Current PFET
 - $R_{DS(on)} = 32\text{ m}\Omega$ at $V_{GS} = -4.5\text{ V}$
 - $R_{DS(on)} = 44\text{ m}\Omega$ at $V_{GS} = -3\text{ V}$
 - $R_{DS(on)} = 82\text{ m}\Omega$ at $V_{GS} = -1.8\text{ V}$
 - $R_{DS(on)} = 93\text{ m}\Omega$ at $V_{GS} = -1.5\text{ V}$
 - $R_{DS(on)} = 155\text{ m}\Omega$ at $V_{GS} = -1.2\text{ V}$
- Adjustable Turnon and Turnoff Slew Rate Control Through External R1, R2, and C1
- Supports a Wide Range of 1.2-V to 8-V Supply Inputs
- Integrated NMOS for PFET Control
- NMOS ON/OFF Supports a Wide Range of 1-V to 8-V Control Logic Interface
- Full ESD Protection (All Pins)
 - HBM 2 kV, CDM 500 V
- Ultra-Low Leakage Current in Standby (Typical 100 nA)
- Available in Tiny 6-Pin Package
 - 2.9 mm × 2.8 mm × 0.75 mm SOT (DDC)

2 Applications

- High-Side Load Switches
- Inrush Current Control
- Power Sequencing and Control
- Standby Power Isolation
- Portable Power Switches

3 Description

The TPS27081A device is a high-side load switch that integrates a Power PFET and a Control NFET in a tiny package.

The TPS27081A features industry-standard ESD protection on all pins providing better ESD compatibility with other onboard components.

The TPS27081A level shifts ON/OFF logic signal to VIN levels and supports as low as 1-V CPU or MCU logic to control higher voltage power supplies without requiring an external level-shifter.

Switching a large value output capacitor CL through a fast ON/OFF logic signal may result in an excessive inrush current. To control the load inrush current, connect a resistor R2 and add an external capacitor C1 as shown in the [Simplified Schematic](#). To configure the TPS27081A to achieve a specific slew rate, refer to the [Application and Implementation](#) section.

A single pullup resistor R1 is required in standby power switch applications. In such applications connect the R2 pin of the TPS27081A to the system ground when inrush current control is not required.

5 Pin Configuration and Functions

Pin Functions

PIN		I/O ⁽¹⁾	DESCRIPTION
NAME	NO.		
ON/OFF	5	I	Active high enable. When driven with a high-impedance driver, connect an external pull down resistor to GND
R1/C1	6	I	Gate terminal of power PFET (Q1)
R2	1	O	Source terminal of NMOS (Q2) . Connect to system GND directly or through a slew rate control resistor
VIN	4	I	Source terminal of power PFET (Q1). Connect a pull-up resistor between the pins VIN/R1 and R1/C1
VOUT	2	O	Drain terminal of power PFET (Q1). Connect a slew control capacitor between pins VOUT and R1/C1
	3		

(1) I = Input, O = Output

6 Specifications

6.1 Absolute Maximum Ratings

Specified at $T_J = -40^{\circ}\text{C}$ to 105°C unless otherwise noted. ⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
$V_{IN(max)}$	VIN pin maximum voltage with reference to pin R2	-0.1	8	V
$V_{OUT(max)}$	VOUT pin maximum voltage with reference to pin R2	-0.1	8	V
$V_{ON/OFF}$	ON/OFF in maximum voltage with respect to pin R2	-0.3	8	V
$I_{Q1(on)}$	Maximum continuous drain current of Q1 at $T_J = 105^{\circ}\text{C}$		3	A
	Maximum pulsed drain current of Q1 ⁽³⁾ at $T_J = 105^{\circ}\text{C}$		9.5	
P_D	Maximum power dissipation at $T_A = 25^{\circ}\text{C}$, $T_J = 150^{\circ}\text{C}$, $R_{\theta JA} = 105^{\circ}\text{C/W}$		1190	mW
T_A	Operating free-air ambient temperature	-40	85 ⁽⁴⁾	$^{\circ}\text{C}$
$T_{J(max)}$ ⁽⁵⁾	Operating virtual junction temperature		150	$^{\circ}\text{C}$
T_{stg}	Storage temperature	-65	150	$^{\circ}\text{C}$

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Refer to TI's design support web page at www.ti.com/thermal for improving device thermal performance.
- (3) Pulse width <300 μs , duty cycle < 2%
- (4) $T_{J(max)}$ limits and other related conditions apply. Refer to SOA charts, [Figure 8](#) through [Figure 12](#).
- (5) Operating at the absolute $T_{J(max)} = 150^{\circ}\text{C}$ can affect reliability. For higher reliability, TI recommends maintaining $T_J < 105^{\circ}\text{C}$.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input voltage	1		8	V
T_A	Operating free-air ambient temperature	−40		85	°C
T_J	Junction temperature	−40		105	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS27081A	UNIT
		DDC (SOT)	
		6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	105	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	43	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	17.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	6.5	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	16.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Specified over the recommended junction temperature range $T_J = -40^{\circ}\text{C}$ to 105°C unless otherwise noted. Typical values specified at $T_A = T_J = 25^{\circ}\text{C}$.

7 Detailed Description

7.1 Overview

The TPS27081A device is a load switch capable of handling up to 8 V and 3 A. To reduce voltage drop for low voltage and high current rails, the device implements an ultra-low resistance P-channel MOSFET which reduces the dropout voltage through the device.

The device has a programmable slew rate which helps reduce or eliminate power supply droop due to large inrush currents. During shutdown, the device has very low leakage currents.

7.2 Functional Block Diagram

7.3 Feature Description

The TPS27081A device uses a low-voltage power PMOS transistor used as the pass element or switch between the supply and load. The device also uses an NMOS transistor to turn the PMOS on and off by interfacing with a wide range of GPIO voltages. Asserting an input voltage higher than V_{IH} (1 V) enables the PMOS switch by turning the NMOS and the NMOS driving the PMOS gate towards ground. When using R2 to control output rise time and a pullup resistor R1 to tie the gate of the PMOS to the source to ensure turnoff, be sure to use an R1 value big enough to source a small enough of current into R2 to not grossly effect the PMOS ON-state gate voltage.

TPS27081A offers additional ports to control the output rise time by connecting passive elements between these pins, VIN, and VOUT.

7.4 Device Functional Modes

7.4.1 ON/OFF

When $V_{IN} > \text{approximately } 1 \text{ V}$ and $V_{(ON/OFF)} > 1 \text{ V}$, the switch turns on and $V_{OUT} \approx V_{IN}$.

When $V_{IN} > \text{approximately } 1 \text{ V}$ and $V_{(ON/OFF)} < 1 \text{ V}$, the switch turns off and $V_{OUT} \neq V_{IN}$.

7.4.2 Fastest Output Rise Time

Whenever it is desired to achieve the fastest output rise time, tie pin 1 (R2) to ground and do not put a capacitor between VOUT (pins 2 and 3) and R1 and C1 (pin 6).

7.4.3 Controlled Output Rise Time

Whenever it is desired to control the output rise time, tie pin 1 (R2) to a resistance (R2) and put a capacitor (C1) between VOUT (pins 2 and 3) and R1 and C1 (pin 6). The values needed to determine a certain output rise time can be determined by [Equation 3](#).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

This section highlights some of the design considerations when implementing this device in various applications.

8.2 Typical Application

8.2.1 Standard Load Switching Application

The TPS27081A device is a high-side load switch that integrates a power PFET and a control NMOS in a tiny package. The device internal components are rated for up to 8-V supply and support up to 3 A of load current. The device can be used in a variety applications. Figure 13 shows a general application of the TPS27081A device to control the load inrush current.

Figure 13. Standard Application Diagram

8.2.1.1 Design Requirements

Table 1. Component Table

COMPONENT	DESCRIPTION
R1	Level shift and pullup resistor
R2	Optional ⁽¹⁾
C1	Optional ⁽¹⁾

(1) Required for load inrush current (slew rate) control.

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Configuring Q1 ON Resistance

The $V_{GS(Q1)}$ gate-to-source voltage across the PMOS transistor Q1 sets its ON-resistance $R_{Q1(on)}$. Directly connecting the pin R2 to ground maximizes the ON state $V_{GS(Q1)}$ and thus minimizes the VIN to VOUT voltage dropout. Equation 1 describes the $V_{GS(Q1)}$ when a resistor R2 is installed to control the turnon slew rate.

$$V_{GS(Q1)} = -V_{VIN} \times \frac{R_{R1}}{(R_{R1} + R_{R2})} \quad (V)$$

(1)

For example, when $R_{R1} = 10 \times R_{R2}$ and $V_{VIN} = 5 \text{ V}$, $V_{GS(Q1)} = -4.5 \text{ V}$

NOTE

TI recommends maintaining $R_{R1} > 10 \times R_{R2}$. The higher value of resistor R1 minimizes quiescent current when PMOS is on, however, the higher value may adversely impact OFF-state leakage current. Refer to the load current (I_{LOAD}) specifications in the [Electrical Characteristics](#) table.

8.2.1.2.2 Configuring Turnon Slew Rate

Switching a large capacitive load C_{LOAD} instantaneously results in a load inrush current given by [Equation 2](#).

$$I_{INRUSH} = C_{LOAD} \times \frac{dv}{dt} = C_{LOAD} \times \frac{V_{OUT(final)} - V_{OUT(initial)}}{V_{OUT(SR)}}$$

where

- $V_{OUT(SR)}$ is the output voltage slew rate (2)

An uncontrolled fast rising ON/OFF logic input may result in a high slew rate at the output resulting in a very high dv/dt , thus, leading to a higher inrush current. To control the inrush current, connect a resistor R2 and a capacitor C1 as shown in [Figure 13](#). Use the following equation to configure the TPS27081A slew rate to a specific value. Refer to [Table 2](#) for component values to configure TPS27081A to achieve standard slew rates.

$$t_{RISE} = \frac{3.9 \times R_{R2} \times C_{C1}}{(V_{VIN})^{2/3}} \text{ (s)}$$

where

- t_{RISE} is the time delta starting from the rising edge of the ON/OFF signal to charge up the load capacitor C_{LOAD} from 10% to 90% of V_{IN} voltage. (3)

NOTE

[Equation 3](#) is accurate to within $\pm 20\%$ across full V_{IN} range supported by TPS27081A. Ensure that $R1 > 10 \times R2$.

Table 2. Component Values for VOUT Rise Time

C_{C1}	RISE TIME (μs) ⁽¹⁾⁽²⁾							
	$R_{R1} = 10 \text{ k}\Omega, R_{R2} = 1 \text{ k}\Omega$				$R_{R1} = 5.1 \text{ k}\Omega, R_{R2} = 510 \Omega$			
	$V_{VIN} \text{ (V)}$				$V_{VIN} \text{ (V)}$			
	7	5	3.3	1.2	7	5	3.3	1.2
220 pF	0.253	0.316	0.416	0.810	0.129	0.161	0.212	0.413
1000 pF	1.15	1.44	1.89	3.68	.586	.732	.963	1.88
4700 pF	5.4	6.75	8.88	17.3	2.76	3.44	4.53	8.83
0.18 μF	207	258	340	663	106	132	173	338
0.27 μF	310	388	510	994	158	198	260	507
0.33 μF	379	474	623	1220	194	242	318	620
1 μF	1150	1440	1890	3680	586	732	963	1880

(1) $C_{LOAD} = 10 \mu F$. Output rise time is independent of C_{LOAD} when $C_{LOAD} \gg C_{C1}$.

(2) Rise time is 250 ns for $R_{R2} = 0 \Omega$ and $C_{C1} = C_{LOAD} = 0 F$.

8.2.1.2.3 Configuring Turnoff Delay

TPS27081A PMOS turnoff delay from the falling edge of ON/OFF logic signal depends upon the component values of resistor R1 and capacitor C1. Lower values of resistor R1 ensures quicker turnoff.

$$t_{off} > 2 \times R1 \times C1 \text{ sec} \quad (4)$$

8.2.1.2.4 Low Voltage ON/OFF Interface

The $V_{GS(Q2)}$ is set by the ON/OFF logic level. To turn ON, the transistor Q2 requires a $V_{GS} > 1.0$ V (typical). For reliable operation, apply ON/OFF logic following the high-level input voltage (V_{IH}) and low-level input voltage (V_{IL}) limits expressed in [Equation 5](#) and [Equation 6](#).

$$V_{IH(on)} > 1.0 \text{ V} + I_{Q2} \times R2 \text{ V} \quad (5)$$

$$V_{IL(off)} < 0.2 \text{ V} \quad (6)$$

Minimizing $I_{Q2} \times R2$ drop helps achieve a direct interface with a low voltage ON/OFF logic. To minimize $I_{Q2} \times R2$ voltage drop, select a high R1 and R2 ratio. For example, when $V_{VIN} = 1.8$ V, selecting R1 and R2 = 40 requires $V_{IH} > 1 + 45$ mV and thus allowing a 1.2-V GPIO interface.

In applications where ON/OFF signal is not available, connect ON/OFF pin to VIN. The TPS27081A turns ON/OFF in sync with the input supply connected to the VIN pin.

NOTE

Connect a pulldown resistor between ON/OFF pin to GND when ON/OFF is driven by a high-impedance (tri-state) driver.

8.2.1.2.5 ON-Chip Power Dissipation

Use [Equation 7](#) to calculate TPS27081A ON-chip power dissipation P_D :

$$PD = I_{DQ1}^2 \times R_{Q1(on)} + I_{DQ2}^2 \times R_{Q2(on)}$$

where

- I_{DQ1} and I_{DQ2} are the DC current flowing through the transistors Q1 and Q2, respectively. (7)

Refer to [Electrical Characteristics](#) and/or [Figure 1](#) through [Figure 7](#) to estimate $R_{Q1(on)}$ and $R_{Q2(on)}$ for various values of $V_{GS(Q1)}$ and $V_{GS(Q2)}$, respectively.

NOTE

MOS switches can get extremely hot when operated in saturation region. As a general guideline, to avoid transistors Q1 and Q2 going into saturation region, set $V_{GS} > V_T + V_{DS}$. For example, $V_{GS} > 1.5$ V and $V_{DS} < 200$ mV ensures operation as a switch.

8.2.1.3 Application Curves

Figure 14. Output Rise Time and Inrush Current

Figure 15. Output Rise Time and Inrush Current

Figure 16. Output Rise Time and Inrush Current

8.3 System Examples

8.3.1 Standby Power Isolation

Many applications have some always ON modules to support various core functions. However, some modules are selectively powered ON or OFF to save power and multiplexing of various on board resources. Such modules that are selectively turned ON or OFF require standby power generation. In such applications TPS27081A requires only a single pull-up resistor. In the configuration shown in [Figure 17](#), the VOUT voltage rise time is approximately 250 ns when $V_{VIN} = 5\text{ V}$.

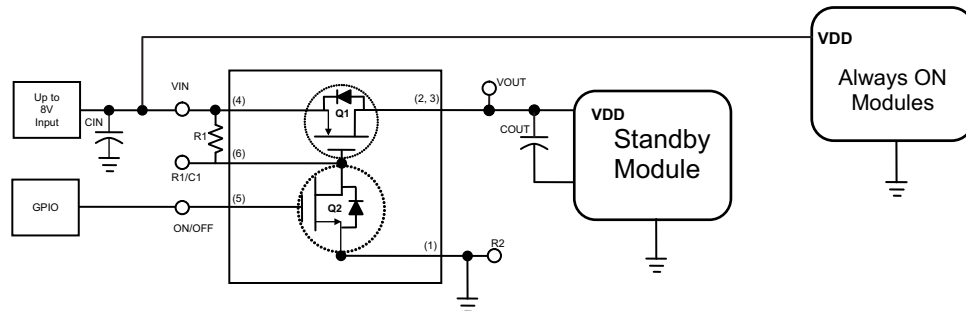

Figure 17. Standby Power Generation Using TPS27081A

8.3.2 Boost Regulator With True Shutdown

The most common boost regulator topology provides a current leakage path through inductor and diode into the feedback resistor even when the regulator shuts down. Adding a TPS27081A device in the input-side power path prevents this leakage current and thus providing a true shutdown, as shown in [Figure 18](#).

LCD panels require inrush current control to prevent permanent system damages during turnon and turnoff events.

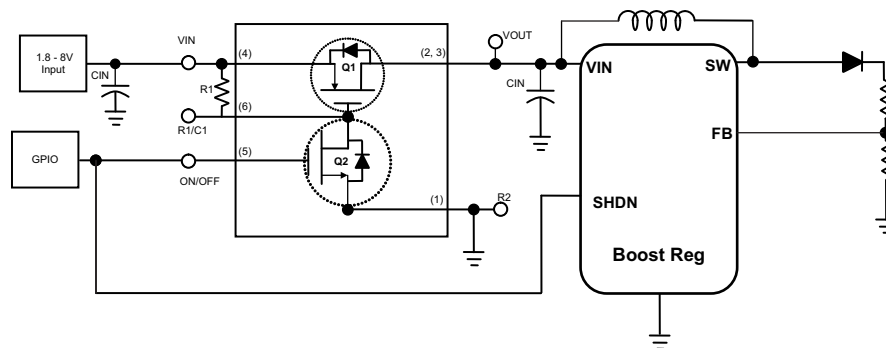

Figure 18. True Shutdown Using TPS27081A

8.3.3 Single Module Multiple Power Supply Sequencing

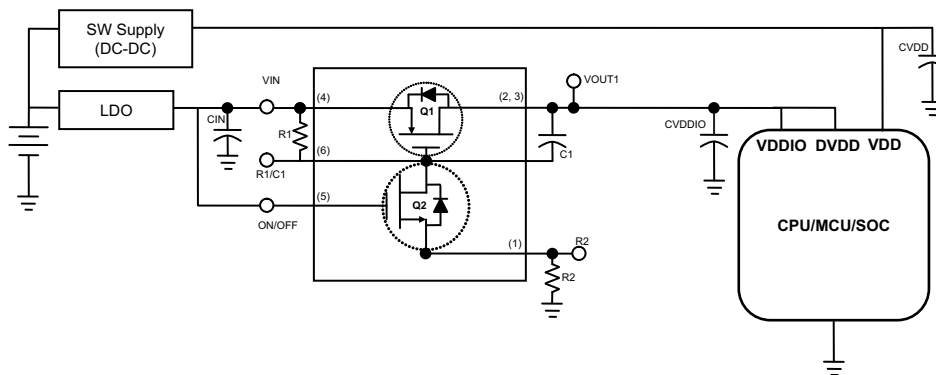

Figure 19. Power Sequencing Using TPS27081A

Figure 20. Power Sequencing Using TPS27081A

System Examples (continued)

8.3.5 TFT LCD Module Inrush Current Control

As shown in Figure 21, LCD panels require inrush current control to prevent permanent system damages during turnon and turnoff events.

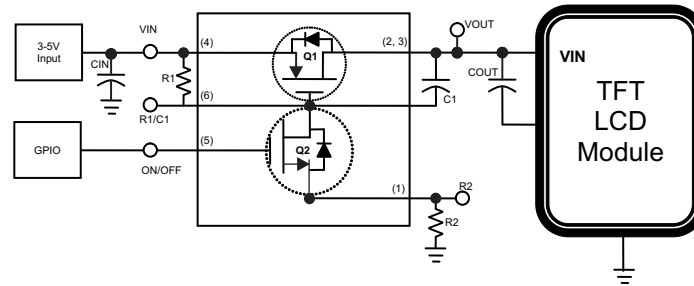

Figure 21. Inrush Current Control Using TPS27081A

8.3.6 Multiple Modules Interdependent Supply Sequencing Without a GPIO Input

When a GPIO signal is not available, connecting the ON/OFF pin of the TPS27081 device as connected to Module 2 powers up Module 2 after powering up Module 1 when the values for resistor R4 and capacitor C1 are chosen appropriately. The two TPS27081A in this configuration as shown in Figure 22 can control load inrush current.

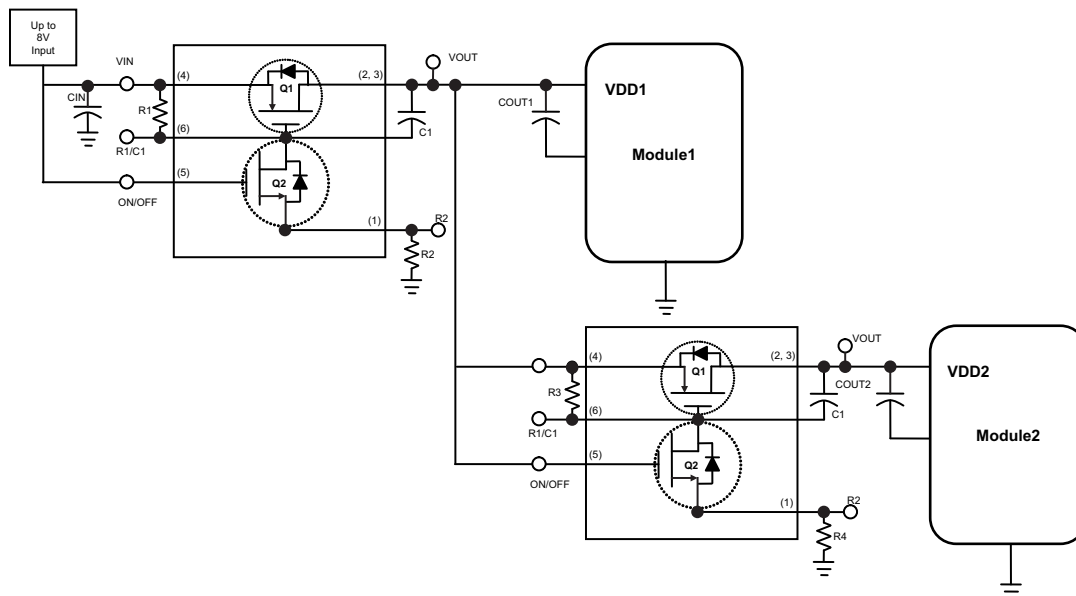

Figure 22. Power Sequencing Using TPS27081A

9 Power Supply Recommendations

The device is designed to operate from a VIN range of 1 V to 8 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1- μ F bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 1 μ F may be sufficient.

10 Layout

10.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- VIN and VOUT traces should be as short and wide as possible to accommodate for high current.
- The VIN pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1- μ F ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device pins as possible.
- The VOUT pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the VIN bypass capacitor of X5R or X7R dielectric rating. This capacitor should be placed as close to the device pins as possible.

10.2 Layout Example

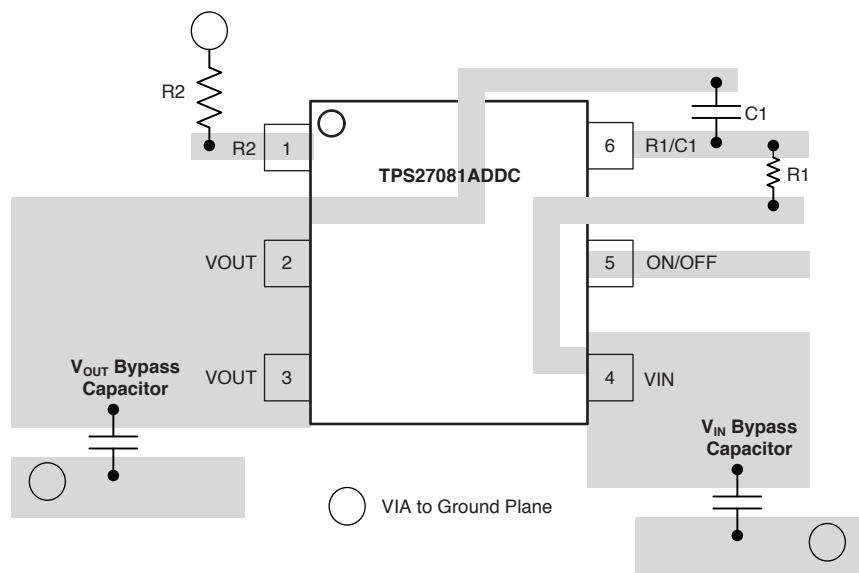

Figure 23. Layout Example

10.3 Thermal Reliability

For higher reliability, TI recommends limiting the TPS27081A die junction temperature to less than 105°C. The device junction temperature is directly proportional to the ON-chip power dissipation. Use the following equation to calculate maximum ON-chip power dissipation to achieve the maximum die junction temperature target:

$$PD_{MAX} = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

where

- $T_{J(max)}$ is the target maximum junction temperature
- T_A is the operating ambient temperature
- $R_{\theta JA}$ is the package junction to ambient thermal resistance

(8)

10.4 Improving Package Thermal Performance

The package $R_{\theta JA}$ value under standard conditions on a High-K board is listed in . $R_{\theta JA}$ value depends on the PC board layout. An external heat sink and/or a cooling mechanism, like a cold air fan, can help reduce $R_{\theta JA}$ and thus improve device thermal capabilities. Refer to TI's design support web page at www.ti.com/thermal for a general guidance on improving device thermal performance.

11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS27081ADDCR	ACTIVE	SOT	DDC	6	3000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	AUA	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS27081ADDCR	SOT	DDC	6	3000	180.0	9.5	3.17	3.1	1.1	4.0	8.0	Q3

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS27081ADDCR	SOT	DDC	6	3000	184.0	184.0	19.0

DDC (R-PDSO-G6)

PLASTIC SMALL-OUTLINE

4204403-3/E 06/05

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion.
 - Falls within JEDEC MO-193 variation AA (6 pin).

DDC (R-PDSO-G6)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
